EDUCATION

Indian Institute of Technology Delhi

July'16 - July'20

Bachelor's of Technology

All India Rank: *Obtained a rank **776** out of 1.5 million students across India in JEE (advanced)*

WORK EXPERIENCE

Deccan AI, Senior Software Engineer

June 2024 – Present

- Designed and built a highly scalable, multi-stage data annotation platform with configurable stages for annotation, review, LLM-based validation, proctoring, and workflow supervision. Architected the template and config driven workflow engine with extensible stage types, enabling new st to be introduced without code changes.
- Implemented AI-based fraud detection and proctoring mechanisms to ensure data integrity across high-volume annotation workflows, enhancing annotation quality while reducing fraud-induced losses and rework costs.
- Structured backend domains including data inventory, master data, workflow orchestration, and reporting for feature-level isolation.
- Built cloud-agnostic, self-hostable services enabling deployments in client-managed enterprise environments.
- Enabled onboarding and delivery for enterprise clients including Google, Cisco, Snowflake, and Microsoft.
- Built a configuration-driven form builder enabling no-code UI creation for annotation and review workflows.
- Supported rich components including text, options, markdown, images, and code blocks to remove engineering dependency for UI changes.
- Developed a template-based reporting service generating structured reports combining data directly from PostgreSQL tables and MongoDB.
- Enabled internal and business teams to produce post-annotation datasets, insights, and validations without custom queries.
- Decomposed authentication and authorization into a standalone microservice consumed by multiple internal services.
- Implemented RBAC, user blacklisting, and fraud-blocking mechanisms while removing third-party auth providers.
- Built a template-driven communication service supporting email, SMS, WhatsApp, and in-app notifications.
- Designed plug-and-play third-party integrations with configuration-based provider switching for cost and reliability.
- Implemented task order management and review reconciliation for accurate, traceable payouts.
- Ensured concurrency-safe payment processing using distributed locking (Redlock).

BlinkIt, Software Engineer

Sep'20 - Oct'21

- Built backend services to automate customer retention offers and targeted notifications at scale.
- Developed and maintained Python–MySQL data pipelines within JupyterHub for marketing and growth analytics.
- Automated ingestion workflows feeding Redash dashboards consumed across multiple business teams.
- Optimized batch execution and query patterns to support reliable high-volume data processing.

CitiCorp, Summer Intern, Machine Learning

May'19 - July'19

- Built and productionized a Random Forest–based risk classification model using customer transaction history.
- Delivered an end-to-end ML pipeline integrated with internal risk systems and received a Pre-Placement Offer.

SKILLS & INTERESTS

Languages: Go, Java, Python, C/C++, Bash

Backend: Distributed Systems, Microservices, REST APIs, Spring Boot

Databases: PostgreSQL, MySQL, MongoDB, SQLite, NoSQL

Frontend: React, TypeScript, JavaScript

Tools: Git, JupyterHub, Redash
